5

CLAIMS

We claim:

1. A method for performing technology mapping, the method comprising:

- a) receiving a design that is not bounded to a particular technology;
- b) repeatedly:

selecting from the design a candidate sub-network,

identifying at least one replacement sub-network from a storage structure that stores replacement sub-networks that are bound to the particular technology,

replacing the selected candidate sub-network in the design with the replacement sub-network,

- c) wherein at least some of the selected candidate sub-networks have multiple circuit elements that provide multiple outputs of the sub-networks.
- 2. The method of claim 1, wherein identifying the replacement sub-network comprises: generating a parameter based on a set of output functions performed by the selected candidate sub-network, wherein the parameter identifies the replacement sub-network.
- 3. The method of claim 2 further comprising: using the parameter to retrieve the replacement sub-network from the storage structure.

5

- 4. The method of claim 2, wherein the set of output functions includes only one output function.
- 5. The method of claim 2, wherein the set of output functions includes one or more output functions.
- 6. The method of claim 1 further comprising:
 terminating the repetitions once a stopping criteria is reached.
- 7. The method of claim 6, wherein the design includes a plurality of circuit elements and the sub-networks are formed by circuit elements, the method further comprising:

after terminating the repetitions, traversing the design to identify circuit elements that are not bound to the technology library;

for each identified circuit element, attempting to identify a replacement sub-network that is stored in the storage structure;

if at least one replacement sub-network for an identified circuit element is identified, replacing the circuit element in the design with the identified replacement sub-network.

8. The method of claim 7, wherein if more than one replacement sub-networks are identified for a circuit element, selecting one of the replacement sub-networks and replacing the circuit element with the selected replacement sub-network.

5

- 9. The method of claim 8, wherein if more than one replacement sub-networks are identified for a circuit element, selecting the replacement sub-network that is better than or as good as the rest of the identified sub-networks.
- 10. The method of claim 7, wherein each circuit element performs a function, wherein if no replacement sub-network is identified for an identified circuit element, decomposing the function of the circuit element into a set of functions, and then attempting to identify a set of replacement sub-networks in the storage structure that perform the set of functions.
- 11. The method of claim 7, wherein traversing the design to identify circuit elements comprises identifying circuit elements that existed in the design when the design was received.
 - 12. The method of claim 7 further comprising:

after traversing the design, repeatedly:

selecting from the design a candidate sub-network,

identifying at least one replacement sub-network from a storage structure that stores replacement sub-networks,

- replacing the selected candidate sub-network in the design with the replacement sub-network.
 - 13. The method of claim 1 further comprising:

before replacing the candidate sub-networks with the replacement sub-networks, evaluating whether to replace the selected candidate sub-network with the replacement sub-network,

wherein certain candidate sub-networks are replaced by replacement sub-networks

based on the evaluation,

wherein certain candidate sub-networks are not replaced based on the evaluations.

- 14. The method of claim 13, wherein the evaluating comprises computing a cost function.
- 13. A computer program embedded on a computer readable medium, the computer program for receiving a design that is not bounded to a particular technology and for mapping the design to the particular technology, the computer program comprising:

a first set of instructions for selecting from the design a candidate sub-network,

a second set of instructions for generating a parameter based on a set of output functions performed by the selected candidate sub-network,

a third set of instructions fro identifying, based on the parameter, at least one replacement sub-network from a storage structure that stores replacement sub-networks,

a fourth set of instructions for replacing the selected candidate sub-network in the design with the replacement sub-network,

a fifth set of instructions for repeatedly executing the first to fourth sets of instructions.

20

5

wherein at least some of the selected candidate sub-networks have multiple circuit elements that provide multiple outputs of the sub-networks.

- 16. The computer program of claim 15, wherein the fifth set of instructions determines whether the computer program has reached a criterion for stopping the repetitions, wherein when the fifth set of instructions terminates the repetitions once the stopping criterion is reached.
- 17. The computer program of claim 16, wherein the design includes a plurality of circuit elements and the sub-networks are formed by circuit elements, the computer program further comprising:

a sixth set of instructions for traversing the design, after terminating the repetitions, to identify circuit elements that are not bound to the technology library,

a seventh set of instructions for attempting to identify, for each identified circuit element, a replacement sub-network that is stored in the storage structure,

an eight set of instructions for replacing a circuit element when at least one replacement sub-network is identified for the circuit element.

18. The computer program of claim 17, wherein each circuit element performs a function, the computer program further comprising:

a ninth set of instructions for decomposing the function of a circuit element into a set of functions when no replacement sub-network is identified for a circuit element;

a tenth set of instructions for attempting to identify a set of replacement sub-networks in the storage structure that perform the set of functions.
